

Developing Collaborative Solutions for Continental-Scale Integrated Water Prediction

COASTAL COUPLING COMMUNITY OF PRACTICE

May 12, 2020

Virtual meeting: meet.google.com/yjn-abkv-kdu

www.weather.gov/watercommunity

[Participants slides](#)

Welcome

Ground Rules

- One person speaks at a time
- Keep the discussion relevant, add new topics to the chat box with your name, you will be called on according to topics
- Say your name before you speak
- Remember to use mute/unmute
- Speak loudly and clearly
- Come prepared to the meeting
- Avoid email and other distractions during the meeting
- Please use video when possible - this increases the effectiveness by 92% over audio only
- Share information on Google docs
- *Poll Everywhere* - put your name next to your question

Meeting Goal

The goal of the meeting is to maintain engagement between Federal agencies and model developers that supports collaborative solutions for continental-scale integrated water prediction. To identify the priorities for engagement, participants will discuss technical advocacy points and data needs (Day 1). To continue the engagement efforts over the last year, participants will engage in a facilitated discussion informed by experience- and research-guided best practices (Day 2).

Meeting Objectives

1. Review the community progress to date.
2. Determine community needs and how to address them.
3. Discuss the need for shared consistent data sets and discuss methods to achieve a centralized repository.
4. Discuss gathering stakeholder requirements and how to translate these into model requirements.
5. Identify future engagement opportunities and the timeline for sustained engagement.

Day 1

- Keynote Speakers
- Discussing the Community's Needs
- Building our Data Infrastructure

A Look Ahead to Day 2

- Developing Capabilities to Serve our Stakeholders
- Define our Community Engagement over the next year

Meeting Facilitators

CAYLA DEAN
CO-OPS Outreach Specialist/Coastal
Scientist, National Water Center

AUDRA LUSCHER
CO-OPS Coastal Hazards Program
Manager

KAREN BAREFORD
National Water Extension Liaison

Interior
U.S. Geological Survey

CC CoP Community needs

Below is a summarized list of the items we have heard so far that the community can advocate for.

- Stakeholder needs to inform model development - recognizing that there are different spatial and temporal scales needed by different stakeholder groups
- Common definitions for ambiguous terminology
- A well-defined grand challenge
- Governing framework to establish guidelines and/or best practices for cooperative methods and technical collaboration (including guidelines for open source code)
- Collaborative environment (e.g., testbed, code repositories) with interdisciplinary teams working together
- Easily accessible, open-source, **quality-controlled data at high resolution** that is updated with a regular frequency for model initialization, data assimilation, verification, and validation
- Well-organized documentation of use or test cases
- Flexible architecture to add new models in a coherent framework
- Transparent pathway to transition models into operations
- 3D modeling in the coastal transition zone

USGS plays a role in all of these areas.

Outline

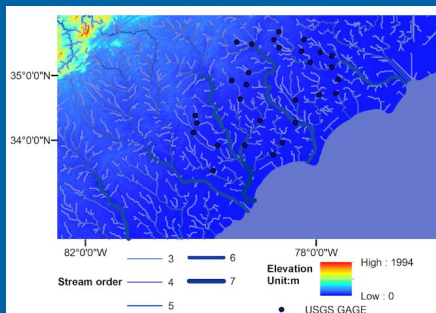

- Topo/Bathy Observations:
 - 1. Structure from Motion
 - 2. Lidar & CoNED merged data sets
- Modeling
 - 3. Total Water Level forecast
 - 4. Coupled modeling hindcasts
- Summary

Structure from Motion

CoNED Viewer

Total Water Level Viewer

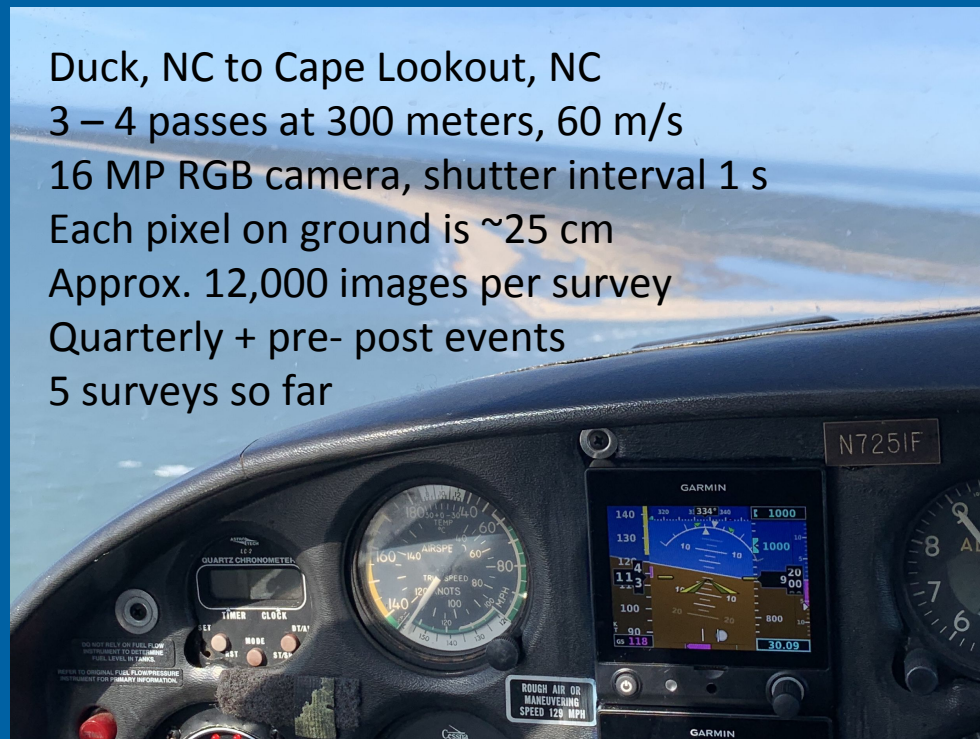

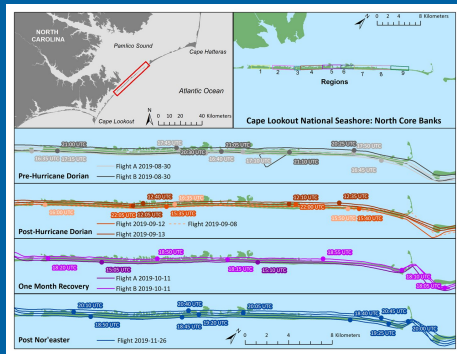

WRF_Hydro model
coupling

1. Structure from motion coastal Topography

Overlapping images along the coast provide continuous coverage

Several surveys focusing on Core Banks area.

Duck, NC to Cape Lookout, NC
3 – 4 passes at 300 meters, 60 m/s
16 MP RGB camera, shutter interval 1 s
Each pixel on ground is ~25 cm
Approx. 12,000 images per survey
Quarterly + pre- post events
5 surveys so far

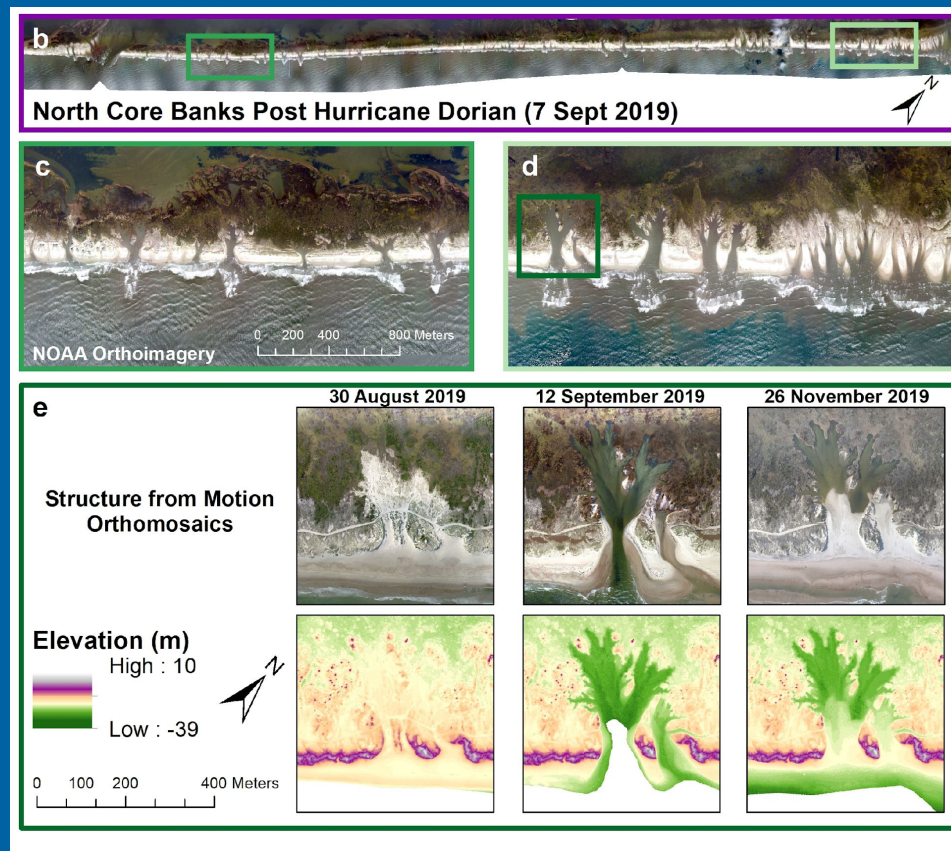

Small aircraft provide flexibility to obtain images.

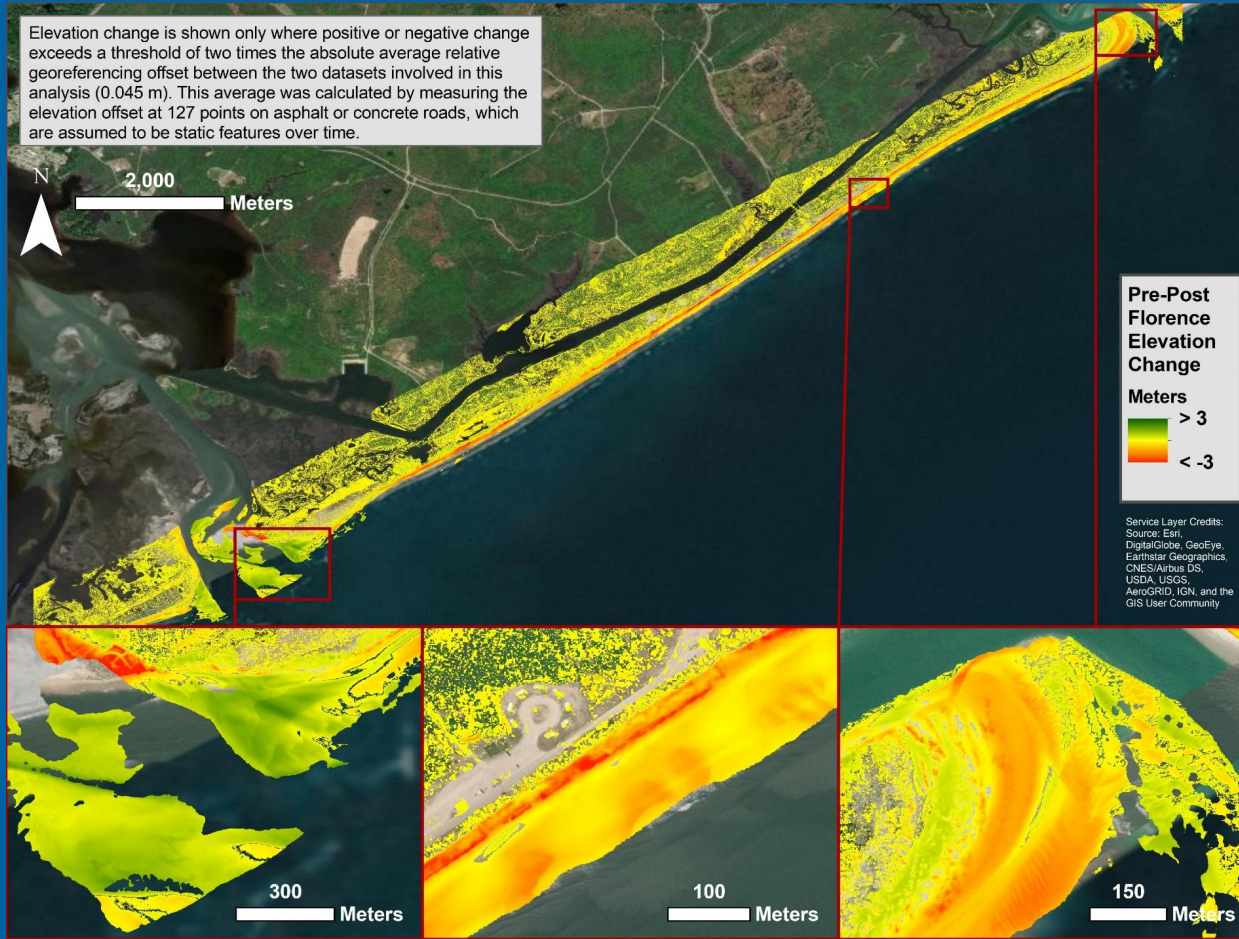

Warrick, Sherwood, Brown. Contributors: Wright, Kranenburg, Ritchie, Over
Funding from CMHRP Remote Sensing Coastal Change Project, DUNEX, and Florence Supplemental

1. Structure from motion coastal Topography

- Structure-from-Motion photogrammetry: DEMs and orthomosaics
- Vertical accuracy ~12 cm
- Difference-map precision ~7 cm

2. Coastal Topography: Lidar

Changes in elevation between 2017 pre-storm and 2018 post-storm lidar surveys near Camp LeJeune, NC show extensive dune and beach erosion. Areas near inlets show dramatic changes.

Using these two datasets, the USGS is computing coastal change metrics for North and South Carolina including: dune crest and toe, beach slope and width, shoreline change, and beach and dune volume change.

2. Topography Bathy merged data: CoNED

USGS Coastal National Elevation Database (CoNED) Applications Project

- 1) Support coastal and marine spatial planning, by constructing the Coastal National Elevation Database (CoNED) at select focus regions thereby establishing a topobathymetric elevation model (tbDEM) baseline product for scientific investigations and applications.
- 2) Conduct algorithm remote sensing 3D point cloud (lidar) research to extend the data structure for topobathymetric elevation models and create methods for fostering land change science studies.

LSU

ROMS + WRF-Hydro – grid exchanges

Hurricane Florence

- 3D ROMS (1km resolution) drives a 2D ROMS (100 m resolution)
 - 2D ROMS shares same grid with WRF-Hydro (100 m resolution)
- WRF-Hydro running with land surface routing and channel routing activated
- ROMS water level elevation (zeta) is passed to WRF-Hydro surface routing on hourly basis along the boundary
- Next step: WRF-Hydro feedback to ROMS

Summary

- USGS has strong involvement in CC CoP.
- Structure from Motion method to acquire high resolution nearshore topography after storms.
- Coastal Lidar – data integration into CoNED
- Total Water Level prediction system
- Coupled modeling system integrates many open-source models. Application to Hurricane Florence shows sensitivity of rainfall to model coupling. Beginning stages to couple ROMS to WRF_Hydro to increase ability to predict compound flooding.

COMMUNITY NEEDS - HELP US HELP YOU

The CC CoP has been engaging for a year now. We have hosted several events and provided opportunities for CC CoP members to voice their needs to address this challenging work of coastal coupling. In this session, we will reflect on what we've heard over the last year, gather community input on what things we may have missed, and coalesce our ideas helping to guide forward progress in a more proactive and less reactive manner.

Need Prioritization

1. *Easily accessible, open-source, quality-controlled data at high resolution that is updated with a regular frequency for model initialization, verification, and validation (1.28)*
2. Governing framework to establish guidelines/best practices for cooperative methods and technical collaboration (1.42)
3. Collaborative environment (e.g., testbed) with interdisciplinary teams working together (1.44)
4. *Stakeholder needs to inform model development (1.48)*
5. Well-organized documentation of use or test cases (1.53)
6. Flexible architecture to add new models in a coherent framework (1.53)
7. Transparent pathway to transition models into operations (1.55)
8. 3D modeling in the coastal transition zone (1.65)
9. A well-defined grand challenge (1.67)
10. Common definitions for ambiguous terminology (1.88)

Average scores based on 32 responses - 1 is high priority and 3 is low priority

Easily accessible, open-source, quality-controlled data

- Need community or community-contributed tools to read, process the high resolution open source data
- Data is needed particularly during extreme events (model development and validation)
- Focus should not be on access, but rather on regularly updating the data

Governing framework to establish guidelines/best practices

- Many commented that Governance either doesn't exist or are not aware of any examples
- Could the CC CoP leverage the best practices from Earth Prediction Innovation Center (EPIC) related to governance

Collaborative environment (e.g., testbed)

- Programs and initiatives need to be developed to fully realize this priority, as currently testbeds are focused too narrowly to suit specific models
- Collaborative environment through testbeds are beneficial especially when they include participation of stakeholders

Stakeholder needs to inform model development

- Stakeholders are many and highly variable, so need to prioritize which are key for our efforts
- A common place to document stakeholder requirements is needed
- Better connections needed between the work related to the Service Delivery Objective Team with stakeholder needs assessment and connect those back to model development

Well-organized documentation of use or test cases

- Highly supported by the Community as it encourages reproducibility, needs to be more widespread and uniform
- We should attempt to leverage what is being developed within the Unified Forecast System and EPIC using GitHub. For example, NWS just released the Medium Range Forecast via GitHub with use cases

Additional Needs Mentioned

- Deficiencies in precipitation measurements lead to inadequacies in modeling the rainfall in the flood transition zone
- A training plan on both model configuration and validation as well as on the products and services that evolve from the implementation of a coupled coastal modeling framework
- Description and evaluation of tools and technologies for visualizing model output

BUILDING OUR DATA INFRASTRUCTURE

One need that we have heard repeatedly is the need for access to shared and consistent data sets in formats that are readily usable for experimentation. This session will address this specific need and brainstorm on how this group can help to get such a dataset.

BREAK

12:00-12:15 PM CT

Data Infrastructure Breakout Group Discussion

- What data is needed?
 - What of the identified data already exists?
 - What doesn't?
- We know some categories of data users that have different needs:
 - Ocean model developer
 - Hydrology model developer
 - Groundwater model developer
 - Visualization or decision support tool developer
- In this session, we will gather a list of our data needs and gain an understanding how you and the community can help to address this challenge

CC CoP need: Easily accessible, open-source, quality-controlled data

- Need community or community-contributed tools to read, process the high resolution open source data
- Data is needed particularly during extreme events (model development and validation)
- Focus should not be on access, but rather on regularly updating the data

What is DesignSafe?

- A web-based research platform that provides tools to manage, analyze, and understand critical data for natural hazards research

DesignSafe Vision

- A cyberinfrastructure (CI) that is an integral part of research discovery
 - Provide a platform for data sharing/publishing
 - Enable research workflows and access to high performance computing (HPC)
 - Deliver cloud-based tools that support the analysis, visualization, and integration of diverse data types
- Amplify and link the capabilities of natural hazards researchers in the US and abroad

QuakeCoRE/NCREE Blind Prediction Competition

The QuakeCoRE center in New Zealand, in collaboration with the National Centre for Research on Earthquake Engineering (NCREE) in Taiwan and DesignSafe in the US, is excited to announce a competition to predict the response of reinforced concrete (RC) structures with torsional irregularities to earthquake shaking. Expressions of interest are due by 5 pm on May 01, 2019 (New Zealand time).

PRJ-2363 | SOIL-FOUNDATION-STRUCTURE INTERACTION POTENTIAL OF SILTS AND CLAYS

PI

CoPIs

Project Type

Keywords

Brandenberg, Scott

Stewart, Jonathan

Experimental

Cyclic Softening, Fine-Grained Soil, Soil-Foundation-Structure Interaction

Earthquake-induced ground failure has resulted in billions of dollars of damage during recent earthquakes. The failure of fine-grained soils, which are less well understood than "sand-like" soils. Cyclic failure of fine-grained soils are and not in the free-field soils away from the structures, indicating that soil-foundation-structure interaction is important in centrifuge model testing to study cyclic failure of fine-grained soils beneath structures. This research contains all of the experimental measurements and metadata required for users to make sense of the data.

CUAHSI HydroShare

What is CUAHSI? (kuh – WAH – see)

- **CUAHSI is a non-profit consortium of about 130 U.S. academic institutions, non-profits, international universities; and private companies**
- **Mission is to advance water science by:**
 - **Strengthening interdisciplinary collaboration in water-sciences**
 - **Providing critical community infrastructure**
 - **Promoting education in the water sciences**
- **Activities**
 - **Community Services, such as workshops, community meetings, training, etc.**
 - **Data and Model Services, including HIS and HydroShare**

CUAHSI Summer Institute

- Partnership between NWS and CUAHSI.
- Involvement of academic community, NCAR, DHS, US ACE, USGS, local orgs.
- Participants:
 - Theme Leaders and their invitees (6+)
 - Student Course Coordinators (2 – 3)
 - Students (20 - 30 graduate students)
 - Student Advisors
- Seven-week on-site residential program at the NWC
- Coastal Coupling Theme during last 3 years

Data Infrastructure

- Metadata rich
- Control access
- Formally publish
- Document workflows

Find, Publish, and Operate on Water Data: HydroShare

[MY RESOURCES](#)[DISCOVER](#)[COLLABORATE](#)[APPS](#)[HELP](#)[ABOUT](#)

How it works

1

Create data

Collect your data using the same methods you use now. HydroShare supports a broad set of hydrologic data types.

2

Upload to HydroShare

Upload your data files to HydroShare through the web user interface. HydroShare will automatically extract as much metadata as it can from the files you upload.

3

Describe with metadata

Use HydroShare's simple metadata entry forms to finish describing your data so that your colleagues can find, access, and interpret it.

4

Share with colleagues

You choose who has access to the data and models you have uploaded to HydroShare. You can share with individual users or publish your resources for everyone to access.

Metadata-Rich Content

Gateway to web-based computing

- **Provide immediate value**
 - What can I do now that I may not be able to easily do on my PC? HydroShare is designed to work with 3rd party apps.
- **Model input data preparation**
- **Model execution—link HydroShare data and cloud computing environments).**
 - Jupyter Hub
 - MATLAB Online
- **Reduced needs for software installation and configuration (platform independence).**
- **Pre-configured compute environments for classroom activities and workshops without the need for software installation and configuration.**

CUAHSI Collaboration with Federal Agencies

CUAHSI operates through a 5-year cooperative agreement with NSF. As a result, collaboration with other federal agencies is facilitated through the IAA process.

- **NWS** – Summer Institute at the National Water Center.
- **DHS** – Post-doc: CUAHSI employee, mentored by advisor at Columbia University.
- **NASA** – Training courses: CUAHSI sponsors the class and NASA teaches; exploring ROSES to secure additional support.
- **NASA** – Supporting SWOT mission as an early adopter and providing synthetic and real discharge data to the community.
- **USDA Forest Service** – Teach CUAHSI Short Courses; Support ICRW meetings.
- **USGS** – Joint workshops held under a CRADA; Supporting ELFIE-II OGC activity; host data.
- **U.S. Army Corps of Engineers**—HydroShare instance running behind Corps firewall.
- **EPA** – Hosting IWN sensor web site.
- **Federal Interagency Working Groups.**

SECOORA Southeast Coastal Ocean Observing Regional Association

Data Portal

SECOORA DATA PORTAL

Centralized access to Southeast U.S. coastal and ocean data

FEATURED DATASET

EXPLORE REAL TIME DATA SEARCH 2300+ DATASETS GLIDERS

SECOORA Data Portal

Go to version 1.0 portal »

Welcome to the new SECOORA Data Portal! Use the portal to:

- Search and download real-time data
- Search historical data
- Compare datasets from different stations
- Generate and share custom data views (how to coming soon!)
- Access metadata for SECOORA stations
- Access to regional and sub-regional models, including coastal circulation, water quality and fisheries habitat models.

Coming soon the portal will provide access to regional and sub-regional models, including coastal circulation, water quality and fisheries habitat models.

Explore map Catalog Glider deployments

SECOORA meets federal standards for:

- Data gathering
- Data management
- Long-term archiving

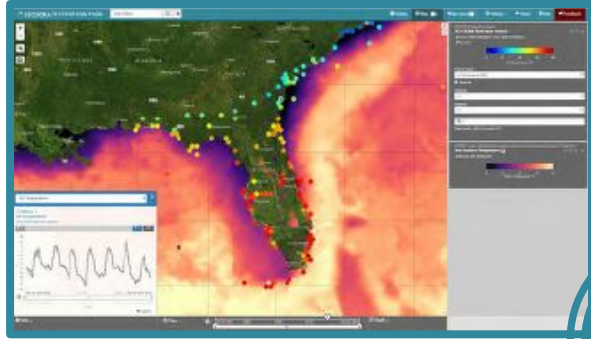

Operate:

- inclusively
- transparently
- solicit input

SECOORA Data Portal - <https://portal.secoora.org/>

Provide an Integrated Look at Data

Map

Visualize data from many sources, download data

Over 2300
searchable
datasets!

Search data, metadata & download data

Data Views

Rapidly assimilate & compare different data streams

Visit the SECOORA Data Portal: <https://portal.secoora.org/>

SECOORA Data Catalog

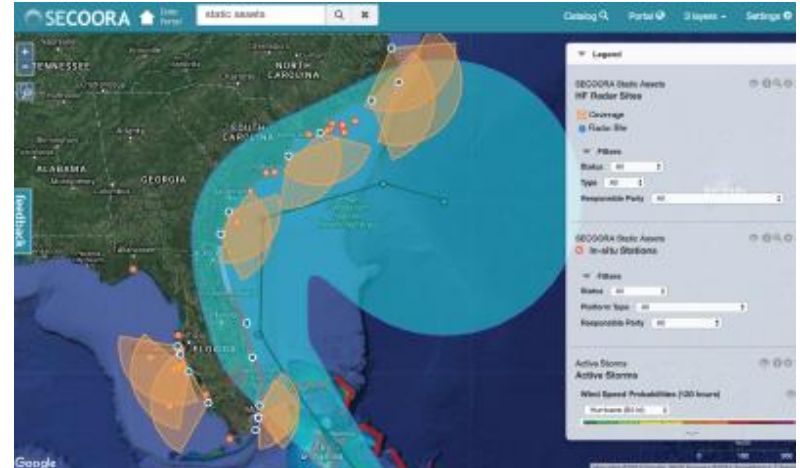

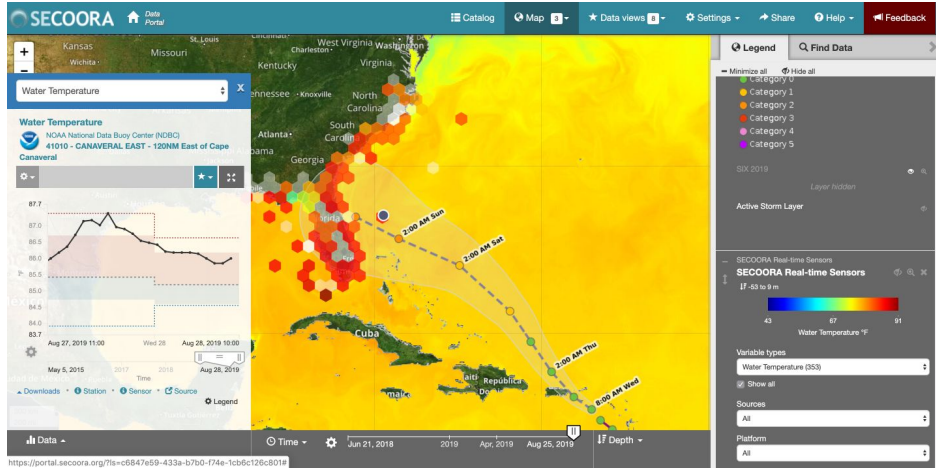

<https://portal.secoora.org/>

- Search over 2,300 datasets
- Use it like google
- Access metadata
- Download data

The screenshot shows the SECOORA Data Catalog portal. At the top, the SECOORA logo and name are displayed, along with the text "Southeast Coastal Ocean Observing Regional Association". Below this is a navigation bar with a home icon, "Data Portal", and various utility icons. A search bar is prominently featured with the placeholder text "Search" and a "Search for data" button. To the right of the search bar, it indicates "1-10 of 2,213 results". Below the search bar, there are filters for "All" (2,213), "Sensor Stations" (1,561), and "Data Layers" (495), along with a "More" dropdown and an "Advanced" filter link. The main content area is divided into two sections: "SECOORA Real-time Sensors" and "SECOORA Historical Sensors". Each section includes a brief description of the data and a small map showing the data distribution. The "Real-time Sensors" section has a "Remove from map" button, while the "Historical Sensors" section has an "Add to map" button. On the right side of the page, there is a "Tags" section with a list of categories and their corresponding counts: Aquaculture (4), Bathymetry (10), Boundaries (19), Coastal and Marine Habitat (52), Cruises (1), Fishery Restrictions (12), Gliders (19), Harmful Algal Blooms (1), Marine Industry (16), Marine Protected Areas (6), Marine Species (16), Mobile Platforms (23), and Models and Forecasts (101).

SECOORA Data Map

Data Infrastructure Breakout Group Discussion

In the previous breakout we discussed what data was needed. Now that we know this and some of the options for data catalogs, what are you willing to contribute

- How can we address the needs identified in the first breakout session?
- What are individual members willing to contribute?
 - Community expectation to provide data
- How can the community own this data need?
 - Working groups
 - Metadata standards
 - Where to catalog data

BREAK

Developing Collaborative Solutions for Continental-Scale Integrated Water Prediction

COASTAL COUPLING COMMUNITY OF PRACTICE

May 13, 2020

Virtual meeting: hangouts link

Poll everywhere info

www.weather.gov/watercommunity

[Participants slides](#)

Ground Rules

- One person speaks at a time
- Keep the discussion relevant, add new topics to the chat box with your name, you will be called on according to topics
- Say your name before you speak
- Remember to use mute/unmute
- Speak loudly and clearly
- Come prepared to the meeting
- Avoid email and other distractions during the meeting
- Please use video - this increases the effectiveness by 92% over audio only
- Share information on Google docs
- *Poll Everywhere* - put your name next to your question

DAY 1 RECAP & DAY 2 PREVIEW

Common Themes from Day 1

What data are needed?

1. River bathymetry/topography
2. Stream gauge observations, including high data mark
3. Validation and initialization data to support models
4. Wave and water currents observations
5. Land cover
6. Precipitation/water level/streamflow/discharge data (including drought conditions)
7. Water quality/temperature
8. Wave data sets, especially in near shore regions
9. Wind
10. Social science data

What of the identified data already exists?

Good examples are out there (the full list of those captured during the breakout sessions will be available in the summary); however, the coverage is lacking

What doesn't?

- Metadata standard adoption
- Future precipitation data for modeling climate change impacts (probabilistic)
- Atlas 14 projected into the future

Common Themes from Day 1 (cont.)

How can we address the needs identified in the first breakout session?

- Ensure discoverability of data sets (Too many repositories, no central search)
- Provide metadata standards and/or examples
- Reach out to specific groups for input (e.g., universities, state and local entities, IOOS and IOOS Regional Associations, Cloud and Big Data projects)
- Apply A.I. from imagery and other remote sensed data to derive missing data (including uncertainty and confidence)
- Provide base funding for certain projects (i.e., data collection for non-named as well as named storms) that are currently only funded through supplementals

Common Themes from Day 1 (cont.)

What are individual members willing to contribute (e.g., Community expectation to provide data)?

- IOOS has a national catalog
- Share knowledge and experience with low cost observation solutions for R&D
- Share crowdsourcing data/techniques

How can the community own this data need?

- Select a central public repository for uploading data
- Set metadata standards
- Ensure discoverability of data sets
- Include industry in the CC CoP
- Engage research testbed partnerships across this community and external partners
- Involve the broader community to support data collection in areas with low population counts

A Look Ahead to Day 2

- Developing Capabilities to Serve our Stakeholders
- Define our Community Engagement over the next year

Stakeholder needs to inform model development

- Stakeholders are many and highly variable, so we need to prioritize which are key for our efforts
- A common place to document stakeholder requirements is needed
- Better connections needed between the work related to the Service Delivery Objective Team with stakeholder needs assessment and connect those back to model development

Stakeholder Needs

Tom Shyka - Northeast Regional Association of Coastal Ocean Observing Systems (NERACOOS)

Stakeholder Needs

Stakeholder Needs

Stakeholders

- NWS regional forecasters
- State coastal zone managers
- Emergency managers
- USCG response
- Agency and academic modelers

Requirements Development Process

Goals: Document requirements for transition plan and improving delivery and use of model products

- Kickoff Meeting
 - Modeling teams, representative stakeholders, project partners
 - Introductions and Information sharing
 - Requirements gathering
- Stakeholder Interviews
 - Requirements gathering
- Annual project meetings
 - Verify requirements
- Stakeholder follow up
- Requirements documentation and management

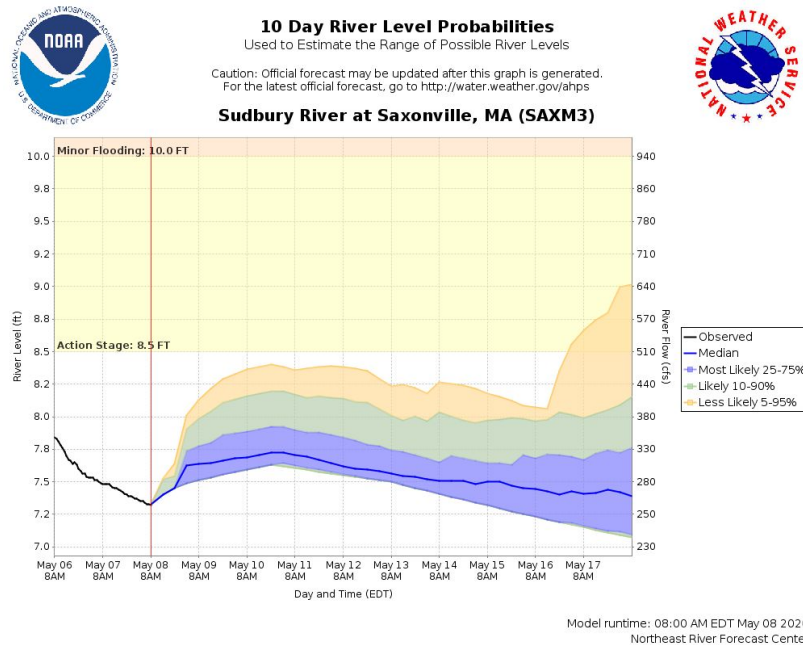

Question: What system or tool do you use for capturing and managing requirements

Stakeholder Needs

Improving Delivery and Use Model Products

- Alert services
- Delivery through GIS
- Model uncertainty presentation
- Programmatic delivery of predictions through AWIPS for NWS forecasters
- Common platform to access model output and find nearby observations for comparison

Question: Have you heard similar requests?

Stakeholder Needs

Benefits

- Stakeholders have improved and streamlined access to predictions they need
- Stakeholders receive predictions in format they can efficiently use
- Stakeholders have more information to support their decision making
- Stakeholders gain a better understanding of the models and their skill
- Lines of communication established between stakeholders and modeling teams

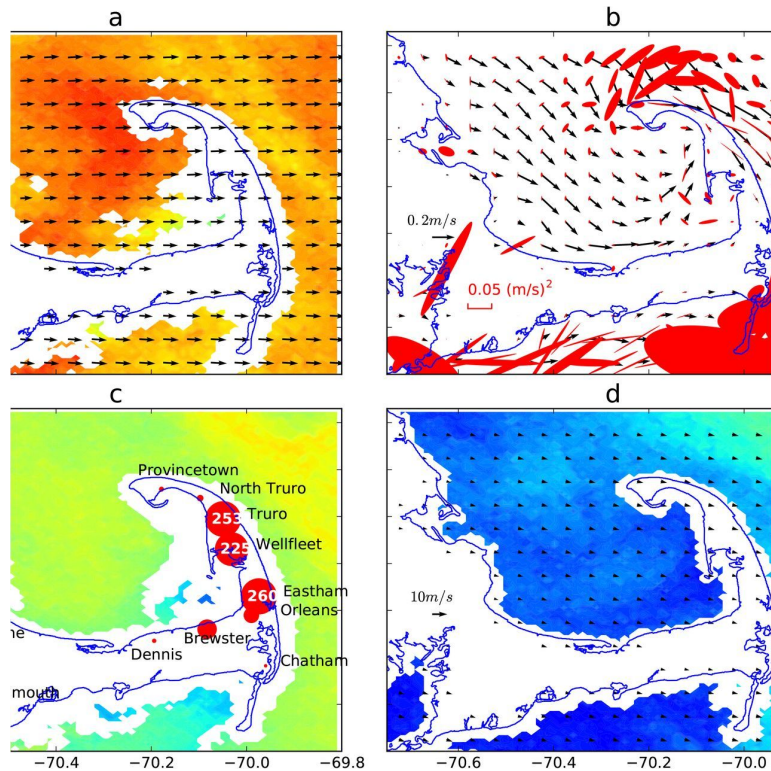

Stakeholder Needs

Benefits

- Broader use of model predictions
- Model teams receive additional feedback on model skill
- Potential for stakeholders to generate observations for validation
- New opportunities for model application and model development
- More interest, use, and more support for model development and operations

[Participants slides](#)

ANNUAL CC CoP ENGAGEMENT PLAN

We have hosted a number of scientific sessions and town halls around coastal coupling and community modeling that have been very well-received. While we have done a good job thus far at engagement, we can do a better job with coordination being transparent and clear on our work and plans for the future as a community. In an effort to accomplish this, this session addresses our first annual engagement plan.

Establishing Ongoing Engagement for the CC CoP

- What we have planned so far (go to Mural)

Establishing Ongoing Engagement for the CC CoP

Other conferences to consider

- ASCE Estuarine and Coastal Modeling conference
- Coastal and Estuarine Research Federation (CERF) biennial conference
- To engage practitioners - consider regional conferences
 - Each IOOS RA hosts an annual meeting involving stakeholders from their region
- Develop a Gordon Conference topic related to coastal coupling
- Association of State Floodplain Managers (ASFPM) conference
- <https://icfm2020.org/> - postponed to August 9 - 11, 2021 - we could propose a session
- International Conference on Coastal Engineering (ICCE) - now postponed until July 2022

Establishing Ongoing Engagement for the CC CoP

Other workshops or training opportunities to consider

- Perhaps CUAHSI could put together a workshop on coastal coupling focusing on details of the hydrology models and the coastal models and various approaches to coupling OR a training on tools to access data and set-up the hydrology and coastal models
- Modeling, Prediction, and Sensor Networks for Coastal Flooding along the US East Coast, 8-9 June 2020, George Mason University, Washington DC
- GitHub training
- There are now many online training courses on machine learning from HPC centers
- Considerations for CC COP-sponsored hack-a-thons or code sprints

Establishing Ongoing Engagement for the CC CoP

Other opportunities for students

- NRL is looking for a shared post-doc with GA Tech to couple WRF-Hydro to another coastal modeling system, SHYFEM
- CUAHSI Summer Institute (canceled this year)
- USACE ERDC is always hiring good coastal engineering students for engaging work
- GLERL sponsors summer internships with our Cooperative Institute, CIGLR
<https://ciglrl.seas.umich.edu/opportunities/student-fellowships/>
- PhD student at UGA - please see here:
<http://www.mattbilskie.com/ms-phd-student-opportunity/>
- Add opportunities page on the CoP website for students, Postdocs and faculty positions

Meeting Highlights and Wrap-up

Exit Poll

Please take a moment to provide feedback on the meeting to help us improve future engagement activities.

This survey will take less than 5 minutes to complete.

Google Form:
